

Algebraic Geometry II
Homework 3
Due Friday, February 6

- (1) Show that a scheme is reduced if and only if all its stalks are reduced.
- (2) Show that a *connected* scheme is integral if and only if all its stalks are integral domains.
- (3) Show that an affine scheme $\text{Spec}(R)$ is disconnected if and only if $R \cong R_1 \times R_2$, with R_1 and R_2 nonzero rings.
- (4) Show that a finite-dimensional reduced (i.e., no nilpotents) algebra over a field is a product of field extensions.
- (5) Show that a finite morphism is quasi-finite.
- (6) Show that a morphism being finite can be checked on a single open cover.
- (7) We will now show how to use schemes to parametrize all Pythagorean triples. Consider the scheme $X = \text{Spec}(\mathbb{Q}[x, y]/(x^2 + y^2 - 1))$.
 - (a) Show that the complement of the point $(1, 0)$ is isomorphic to $\mathbb{A}_{\mathbb{Q}}^1$ using stereographic projection.
 - (b) Find all the maps from $\text{Spec}(\mathbb{Q})$ to X .
 - (c) Describe all the rational solutions to the equation $x^2 + y^2 = 1$.
 - (d) Describe all Pythagorean triples.
- (8) Show that closed immersions are preserved under base change by affine morphisms, i.e., if $i : X \rightarrow Y$ is a closed immersion, then for all affine morphisms $f : Z \rightarrow Y$, the natural map $X \times_Y Z \rightarrow Z$ is also a closed immersion.
- (9) Consider the natural map $\text{Spec}(\mathbb{Z}[\sqrt{2}]) \rightarrow \text{Spec}(\mathbb{Z})$. What scheme-theoretic fibers occur?
- (10) What is the scheme-theoretic intersection of the cuspidal cubic $y^2 = x^3$ in \mathbb{A}^2 with the x -axis? What about the y -axis?
